

第四章 程序设计基本结构

模块4.2: 分支语句和逻辑运算符

主讲教师: 同济大学电子与信息工程学院 陈宇飞 同济大学电子与信息工程学院 龚晓亮

目录

- if语句
- 逻辑表达式
- 字符函数库cctype
- ?:运算符
- switch语句
- break和continue语句

目录

• if语句

- 1. if 语句
- 2. if else语句
- 3. 格式化if else语句
- 4. if else if else结构

1.1 if语句

✓当C++程序必须决定是否执行某个操作时,通常使用if语句来实现 选择

✓if有两种格式: if 和 if else

1.1 if语句

✓单支语句

if (test-condition)

statement

- 口当表达式为真时执行语句序列, 为假则不执行
- 口表达式可以是任意类型,但按逻辑值求解(非0为真0为假)

1.1 if语句

✓单支语句

口表达式后无; (表达式和表达式语句的区别)

口整个单支语句可以作为一个语句来看待(复合语句)

if (表达式;) //编译错 语句序列;

```
// if.cpp -- using the if statement
#include <iostream>
int main()
   using std::cin; // using declarations
   using std::cout;
    char ch;
    int spaces = 0;
    int total = 0;
    cin. get (ch);
   while (ch != '.') // quit at end of sentence
        if (ch == '') // check if ch is a space
            ++spaces;
        ++total; // done every time
        cin. get(ch);
    cout << spaces << " spaces, " << total;</pre>
    cout << " characters total in sentence\n";
   return 0;
```

Microsoft Visual Studio 调试注
 ★

The balloonist was an airhead with lofty goals.

6 spaces, 46 characters total in sentence

- ❖ 仅当ch为空格时,语句 ++spaces; 才被执行
- ❖ 语句++total: 位于if 语句的外面,因此每轮 循环中都将被执行
- ❖ 字符总数中包括按回车 键生成的换行符

1.2 if else语句

✓if语句让程序决定是否执行特定的语句或语句块,而if else语句则让程序决定执行两条语句或语句块中的哪一条,这种语句对于选择其中一种操作很有作用

✓双支语句 if else语句的通用格式

if (test-condition)
 statement1
else
 statement2

1.2 if else语句

- ✓ 当表达式为真时执行 语句序列1,为假则执行 语句序列2
- ✓ 表达式可以是任意类型,但按逻辑值求解(非0为真0为假)
- ✓ 表达式后无;

```
// ifelse.cpp — using the if else statement
                                                   需求:
#include <iostream>
                                                   假设要通过对字母进行加密编码来
int main()
                                                   修改输入的文本 (换行符不变)

    Microsoft Visual Studio 调试择 
    X

    char ch;
                                                   Type, and I shall repeat.
    std::cout << "Type, and I shall repeat. \n"; An ineffable joy suffused me as I beheld
                                                    Bo!jofggbcmf!kpz!tvggvtfe!nf!bt!J!cfifme
    std::cin.get(ch);
                                                    the wonders of modern computing.
    while (ch != '.')
                                                    uif!xpoefst!pg!npefso!dpnqvujoh
                                                    Please excuse the slight confusion.
        if (ch = ' \n')
             std::cout << ch; // done if newline
        else
             std::cout << ++ch: // done otherwise
        std::cin.get(ch);
    std::cout << "\nPlease excuse the slight confusion.\n";
    return 0;
```

1.3 格式化if else语句

- √if else 中的两种操作都必须是一条语句
- ✓如果需要多条语句,需要用大括号括{}括起来,组成一个块语句

```
if (ch == 'z') {
    zorro++;
    cout << "Another Zorro candidate\n";
}
else {
    dull++;
    cout << "Not a Zorro candidate\n";
}</pre>
将语句块与关键字if和else紧密结合在一起
```

1.4 if else if else语句

- ✓计算机也可提供两个以上的选择
- ✓多支语句

```
// ifelseif.cpp -- using if else if else
                                                       Microsoft Visual Studio 调试 ×
#include <iostream>
                                                      Enter a number in the range 1-100 to find my favorite number: 50
                                                      Too high -- guess again: 25
const int Fave = 27;
                                                      Too low -- guess again: 37
                                                      Too high -- guess again: 31
int main()
                                                      Too high -- guess again: 28
                                                      Too high -- guess again: 27
                                                      27 is right!
    using namespace std;
    int n;
    cout << "Enter a number in the range 1-100 to find";
    cout << "my favorite number: ";</pre>
    do
         cin >> n;
         if (n < Fave)
              cout << "Too low -- guess again: ";
         else if (n > Fave)
              cout << "Too high -- guess again: ";
         else
              cout << Fave << " is right!\n";</pre>
    } while (n != Fave);
    return 0;
```

1.4 if else if else语句

✓条件运算符和错误防范

variable == value

例: myNumber == 3

myNumber = 3

注意=和==的区别 int a;

a == 10; 关系表达式,值为0/1

a = 10; 赋值表达式,值为10

value == variable

例: 3 == myNumber

3 = myNumber

后果:编译器只是将3赋给myNmuber (难以发现错误,导致错误结果) 后果:编译器将会发出警告(可及时发现错误,并修正)

✓一般来说,编写让<u>编译器能够发现错误</u>的代码,比找出<u>导致难</u> 以理解的错误的原因要容易得多。

景

• 逻辑表达式

- 1. 逻辑OR运算符: ||
- 2. 逻辑AND运算符: &&
- 3. 用& 来设置取值范围
- 4. 逻辑NOT运算符:!
- 5. 逻辑运算符细节
- 6. 其他表示方式

2.1 逻辑OR运算符:

✓为满足测试多种条件需要,C++提供3中逻辑运算符,来组合或 修改已有的表达式

逻辑OR或(||)

逻辑AND与(&&)

逻辑NOT非(!)

2.1 逻辑OR运算符: ||

✓由于||的优先级比关系运算符低,因此不需要在表达式中使用括号

表 6.1

||运算符

	exprl expr2 的值	
	expr1 = = true	expr1 = = false
expr2 = = true	true	true
expr2 = = false	true	false

2.1 逻辑OR运算符:

✓C++规定, | 运算符是个顺序点(sequence point)。运算符左 边的子表达式先于右边的子表达式。即,先修改左侧的值,再对

右侧的进行判断

```
i = 10;
j = 10;
i++ < 6 || i == j;</pre>
```

✓如果左侧的表达式为true,则C++将不会去判定右侧的表达式

(即短路运算: 当有多个表达式(值)时,左边的表达式值可以确定结果的话,就不再继续运算右边的表达式的值)

```
// or.cpp -- using the logical OR operator
                                                         Microsoft Visual Studio 调试 ×
#include <iostream>
                                                        This program may reformat your hard disk
                                                        and destroy all your data.
int main()
                                                        Do you wish to continue? <y/n> d
                                                        That wasn't a y or n! Apparently you can't follow
                                                        instructions, so I'll trash your disk anyway.
    using namespace std;
    cout << "This program may reformat your hard disk\n"
         "and destroy all your data. \n"
         "Do you wish to continue? <y/n> ";
    char ch;
    cin >> ch;
    if (ch == 'y' || ch == 'Y')
                                                  // y or Y
         cout << "You were warned!\a\a\n";</pre>
    else if (ch == 'n' | | ch == 'N') // n or N
         cout << "A wise choice ... bye\n";
    else
         cout << "That wasn't a y or n! Apparently you
         "can't follow\ninstructions, so "
         "I'll trash your disk anyway. \a\a\n";
    return 0;
```

2.2 逻辑AND运算符: &&

- ✓C++可以采用逻辑AND运算符(&&),将两个表达式组合在一起
- ✓仅当原来两个表达式中都为true(或非零),得到表达式的值为true;否则,表达式的值为false

```
5 == 5 \&\& 4 == 4 // true because both expression are true 5 == 3 \&\& 4 == 4 // false because first expression is false 5 > 3 \&\& 5 > 10 // false because second expression is false 5 > 8 \&\& 5 < 10 // false because first expression is false 5 < 8 \&\& 5 > 2 // true because both expression are true 5 > 8 \&\& 5 < 2 // false because both expression are false
```

2.2 逻辑AND运算符: &&

- ✓由于&&的优先级比关系运算符低,因此不需要在表达式中使用括号
- ✓和||运算符一样,&&运算符也是顺序点,因此将首先判定左侧,并且在右侧被判定前产生所有副作用。如果左侧为false,则整个逻辑表达式必定为false,这种情况下,C++将不会再对右侧进行判定

	exprl && expr2 的值	
	- exprl = = true	exprl = = false
expr2 = = true	true	false
expr2 = = false	false	false

```
// and.cpp -- using the logical AND operator
#include <iostream>
const int ArSize = 6:
int main()
    using namespace std;
    float naaq[ArSize];
    cout << "Enter the NAAQs (New Age Awareness Quotients) "
         << "of\nyour neighbors. Program terminates"</pre>
         << "when you make\n" << ArSize << " entries "</pre>
         << "or enter a negative value.\n";</pre>
    int i = 0;
    float temp;
    cout << "First value: ";</pre>
    cin >> temp:
    while (i \langle ArSize \&\& temp \rangle = 0) // 2 quitting criteria
        naaq[i] = temp;
        ++i:
        if (i < ArSize) // room left in the array
            cout << "Next value: ";</pre>
            cin >> temp; // so get next value
```

```
Enter the NAAQs (New Age Awareness Quotients) of your neighbors. Program terminates when you make 6 entries or enter a negative value. First value: 28 Next value: 72 Next value: 15 Next value: 6 Next value: 6 Next value: 6 Next value: 130 Next value: 145 Enter your NAAQ: 50 3 of your neighbors have greater awareness of the New Age than you do.
```

```
if (i == 0)
   cout << "No data-bye\n":
else
   cout << "Enter your NAAQ: ";
   float you;
   cin >> you;
   int count = 0;
   for (int j = 0; j < i; j++)
       if (naaq[j] > you)
           ++count:
   cout << count:
   cout << " of your neighbors have greater awareness of \n"
        << "the New Age than you do. \n";</pre>
return 0;
```

2.3 用&&来设置取值范围

- ✓ & & 运算符还允许建立一系列if else if else语句, 其中每种选择都对应一个特定的取值范围
- ✓在使用取值范围测试时,应确保范围之间既没有缝隙,又没有 重叠

```
if (age > 17 && age < 35)
    index = 0;
else if (age >= 35 && age < 50)
    index = 1;
else if (age >= 50 && age < 65)
    index = 2;
else
    index = 3;</pre>
```

2.3 用&&来设置取值范围

✓另外,应确保正确设置每个取值范围

if (age > 17 && age < 35) // ok

if (17 < age < 35) // Don't do this! 编译器不会捕获这种错误,因为它是有效的C++语句

〈运算符从左向右结合,因此上述表达式的含义是:

if ((17 < age) < 35)

但: 17<age的值要么为true(1),要么为false(0)。0/1 均<35

整个测试结果都是true! (这是错误的)

```
// more_and.cpp -- using the logical AND operator
                                                       #include <iostream>
                                                      Enter your age in years: 87
const char* qualify[4] = // an array of pointers*/
                                                      You qualify for the pie-throwing festival.
                          // to strings
    "10,000-meter race. \n",
    "mud tug-of-war. \n",
                                           if (age > 17 && age < 35)
    "masters canoe jousting. \n",
                                               index = 0;
    "pie-throwing festival. \n"
                                           else if (age \geq 35 && age < 50)
                                               index = 1;
int main()
                                           else if (age \geq 50 && age < 65)
                                               index = 2;
   using namespace std;
                                           else
    int age;
                                               index = 3;
    cout << "Enter your age in years: ";</pre>
    cin >> age;
                                           cout << "You qualify for the " << qualify[index];</pre>
    int index;
                                           return 0;
                                                                          指针数组为后续内容,
                                                                          此处了解即可
```

- ❖该程序演示了一种用于处理一系列消息的技术
- ❖char指针变量可以通过指向一个字符串的开始位置来标识该字符串
- ❖char指针数组也可以标识一系列字符串,将每个字符串的地址赋给各个数组元素即可

2.4 逻辑NOT运算符:!

✓!运算符将它后面的表达式的真值取反

expression	true (非0)	false (0)
!expression	false (0)	true (非0)

✓通常,不使用!运算符表示关系

if (!(x>5)) // if $(x \le 5)$ is clearer

✓然而,!运算符对于返回值为true-false或可以被解释为true-false的函数来说作用很大

```
// not.cpp -- using the not operator
#include <iostream>
#include <climits>
bool is int(double);
int main()
    using namespace std;
    double num;
    cout << "Yo, dude! Enter an integer value: ";</pre>
    cin >> num;
    while (!is_int(num)) // continue while num is not int-able
        cout << "Out of range -- please try again: ";
        cin >> num;
    int val = int(num); // type cast
    cout << "You've entered the integer " << val << "\nBye\n";</pre>
    return 0;
bool is_int(double x)
    if (x \le INT_MAX \&\& x \ge INT_MIN) // use climits values
        return true;
    else
        return false;
```

```
Microsoft Visual Studio 调试 × + マ
Yo, dude! Enter an integer value: 6234128679
Out of range -- please try again: -8000222333
Out of range -- please try again: 9999
You've entered the integer 9999
Bye
```

- ❖ 当读取int值的程序输入一个过大的值, 一般C++实现程序只是将这个值截短为 合适的大小,并不会通知丢失了数据
- ❖ 将可能的int值作为double值来读取, double类型的精度足以存储典型的int 值,且取值范围更大
- ❖ 布尔函数is_int()使用了climits文件中定义的两个符号常量(INT_MAX和INT_MIN)来确定参数是否位于适当的范围内
- ❖ main()程序使用了while循环来拒绝无效输入,直到用户输入有效的值为止

```
! !A 取反(单目运算符)(3级),高于关系运算符
```

&& A&&B 均为真,取值为真(12级), 低于关系运算符

|| A||B 有一个为真,值为真(13级),低于关系运算符

```
x > 5 && x < 10 

等价于

(x > 5) && (x < 10)
```

age > 30 && age < 45 | weight > 300 等价于

(age > 30 && age < 45) || weight > 300

! !A 取反(单目运算符)(3级),高于关系运算符

&& A&&B 均为真,取值为真(12级), 低于关系运算符

|| A||B 有一个为真,值为真(13级),低于关系运算符

age > 50 | (weight > 300 && donation > 1000)

```
! !A 取反(单目运算符)(3级),高于关系运算符
```

&& A&&B 均为真,取值为真(12级), 低于关系运算符

|| A||B 有一个为真,值为真(13级),低于关系运算符

```
!(x > 5) // is it false that x is greater than 5 人为去掉括号
```

!x > 5 // is !x greater than 5

// !x的值只能是true (0) 或false (1) ,所以该表达式总为false

- ✓虽然C++运算符的优先级规则常可能不使用括号便可以编写复合 比较的语句,但最简单的方法还是用括号将测试进行分组,而不 管是否需要括号(使得代码易读,并且减少由于没有准确记住所 使用的的规则而出错的可能性)

(短路运算)

a&b&&c 若a=0, 值必为0, b, c不求解 a||b||c 若a=1, 值必为1, b, c不求解

(m = a > b) && (n = c > d); //m=0, n不再求解, 保持原值

2.6 其他表示方式

✓当键盘不能提供用作逻辑运算符的符号时,C++标准提供了标识 符and、or、和not,这些C++保留字,不能被用作变量名

- ✓C语言程序需要包含头文件iso646.h,可以将它们用作运算符
- ✓C++不要求使用头文件

表 6.3

逻辑运算符: 另一种表示方式

运算符	另一种表示方式
&&	and
	or
!	not

景目

•字符函数库cctype

3.1 字符函数库cctype

✓C++从C语言继承了一个与字符相关的、非常方便的函数软件包,它可以简化诸如确定字符是否为大写字母、数学、标点符号等工作,这些函数的原型在头文件cctype(cctype.h)中定义

if (isalpha(ch))

-	100	12
玉	6	4
衣	Ο.	4

cctype 中的字符函数

函数名称	返 回 值	
isalnum()	如果参数是字母数字,即字母或数字,该函数返回 true	
isalpha()	如果参数是字母,该函数返回 true	
iscntrl()	如果参数是控制字符,该函数返回 true	
isdigit()	如果参数是数字 (0~9), 该函数返回 true	
isgraph()	如果参数是除空格之外的打印字符,该函数返回 true	
islower()	如果参数是小写字母, 该函数返回 true	
isprint()	如果参数是打印字符(包括空格),该函数返回 true	
ispunct()	如果参数是标点符号,该函数返回 true	
isspace()	如果参数是标准空白字符,如空格、进纸、换行符、回车、水平制表符或者垂直制表符,该函数返回 true	
isupper()	如果参数是大写字母, 该函数返回 true	
isxdigit()	如果参数是十六进制数字,即 0~9、a~f 或 A~F, 该函数返回 true	
tolower()	如果参数是大写字符,则返回其小写,否则返回该参数	
toupper()	如果参数是小写字符,则返回其大写,否则返回该参数	

```
// cctypes.cpp -- using the ctype.h library
                                                                #include <iostream>
                                                               Enter text for analysis, and type @ to terminate input.
                       // prototypes for character functions
#include <cctype>
                                                               khdfflksadjklf djafjdiol jiohoho
                                                               hiohpihi hiohjoho
int main()
                                                               46 letters, 5 whitespace, 0 digits, 1 punctuations, 0 others.
   using namespace std;

     << punct << " punctuations, "</pre>
     << others << " others. \n";</pre>
```

景目

•?:运算符

✓ C++有一个常被用来替代if else语句的运算符,被称为<u>条件运</u> 算符(?:),它是C++中唯一一个需要3个操作数的运算符

✓该运算符的通用格式为: expression1 ? expression2 : expression3

如果expression1为true,则整个条件表达式的值为expression2的值,否则,整个表达式的值为expression3的值

5 > 3 ? 10 : 12 // 5 > 3 is true, so expression value is 10 3 == 9 ? 25 : 18 // 3 == 9 is false, so expression value is 18 int c = a > b ? a : b; // c = a if a > b, else c = b

```
// condit.cpp — using the conditional operator
                                                         Microsoft Visual Studio 调试 ※
#include <iostream>
                                                        Enter two integers: 25 28
                                                        The larger of 25 and 28 is 28
int main()
    using namespace std;
    int a, b;
    cout << "Enter two integers: ";</pre>
    cin \gg a \gg b;
    cout << "The larger of " << a << " and " << b;
    int c = a > b? a : b; // c = a \text{ if } a > b, else c = b
    cout << " is " << c << endl;
    return 0;
```

与if else 序列相比, ?:运算符的区别:

- ✓ 条件运算符更简洁
- ✓ 条件运算符生成一个表达式,是一个值,可以将其赋给变量或将其放到一个更大的表达式中
- ✓ 可以将条件表达式嵌套在另一个条件表达式中(隐藏代码)

cout << ((i < 2) ? !i ? x [i] : y : x [1]));

与if else 序列相比, ?:运算符的区别:

✓ 从可读性来说,条件运算符最合适于简单关系和简单表达式的值

$$x = (x > y) ? x : y;$$

✓当代码变得更复杂时,使用if else语句来表达可能更清晰

目录

• switch语句

- 1. switch语句
- 2. 将枚举量用作标签
- 3. switch和if else

5.1 switch语句

✓当要从多个选项中选择一个时,可以扩展if else if else 序列处理多种情况,但C++的switch语句能够更容易地从大型列表中进行选择

✓ switch语句的通用格式:

```
switch (integer-expression)
{
   case label1 : statement(s)
   case label2 : statement(s)
   ...
   default : statement(s)
}
```

5.1 switch语句

- ❖ 每个标签都必须是整数常量表达式
- ❖ 常见标签是int或char常量(如'1'或 'q'),也可以枚举量
- ❖如果integer-expression不与任何标签 匹配,则程序跳到标签为default行
- ❖如果default标签被省略,而又没有匹配的标签,则程序将跳到switch后面的执行语句
- ❖程序不会在执行到下一个case处自动停止, 必须使用break语句

```
// switch.cpp -- using the switch statement

        case 2: report();
                                                                       "3) alibi
                                                                                            4) comfort\n"
            break:
                                                                       "5) quit\n":
        case 3: cout << "The boss was in all day. \n";
            break:
                                                               void report()
        case 4: comfort();
            break:
                                                                   cout << "It's been an excellent week for business. \n"
        default: cout << "That's not a choice.\n";</pre>
                                                                       "Sales are up 120%. Expenses are down 35%. \n";
        showmenu();
                                                               void comfort()
        cin >> choice:
                                                                   cout << "Your employees think you are the finest CEO\n"
    cout << "Bye!\n";
                                                                       "in the industry. The board of directors think\n"
    return 0;
                                                                        "you are the finest CEO in the industry.\n";
```

5.1 switch语句

- ✓如果删除break语句,程 序将执行case标签后的 所有语句
- ✓这样设计可以使得使用 多个标签很简单
- ✓如例所示,可以为大写标签和小写标签提供相同的语句(case 'a'后面没有break,因此将执行下一行case'A')

```
char choice;
cin >> choice;
 while (choice != 'Q'&& choice != 'q')
    switch(choice)
        case 'a':
        case 'A' : cout \langle \langle " \rangle a \rangle n'';
                     break;
        case 'r':
        case 'R' : cout << report();
                     break;
        default : cout << "That's not a choice. \n"
```

5.2 将枚举量用作标签

- ✓程序enum定义一组相关的常量,然后再switch语句中使用这些常量
- ✓cin无法识别枚举常量,因此该程序要求用户选择选项时输入一个整数
- ✓switch语句将int值和枚举量标签进行比较时,将枚举量提升为int
- ✓在while循环测试条件中,也会将枚举量提升为int类型

//枚举的细节为后续知识,此处了解用法,看懂程序即可

```
// enum.cpp -- using enum
#include <iostream>
// create named constants for 0 - 6
enum { red, orange, yellow, green, blue, violet, indigo };
int main()
   using namespace std;
   cout << "Enter color code (0-6): ";</pre>
   int code;
   cin >> code:
   while (code >= red && code <= indigo)
       switch (code)
       case red: cout << "Her lips were red. \n"; break;
       case orange: cout << "Her hair was orange. \n"; break;
       case yellow: cout << "Her shoes were yellow. \n"; break;
       case green: cout << "Her nails were green. \n"; break;
       case blue: cout << "Her sweatsuit was blue. \n"; break;
       case violet: cout << "Her eyes were violet. \n"; break;
       case indigo: cout << "Her mood was indigo. \n"; break;
       cout << "Enter color code (0-6): ";
       cin >> code:
   cout << "Bye\n";
   return 0:
```

Enter color code (0-6): 3
Her nails were green.
Enter color code (0-6): 5
Her eyes were violet.
Enter color code (0-6): 2
Her shoes were yellow.
Enter color code (0-6): 8
Bye

5.3 switch和if else

✓ switch语句和if else语句都允许程序从选项中进行选择 区别:

- ✓相比之下, if else更通用, 它可以处理取值范围
- ✓ switch语句中每个case标签都必须是一个单独的值(常量), 且必须是整数(包括char),因此switch无法处理浮点测试

5.3 switch和if else

- ✓如果选项<u>涉及取值范围</u>、<u>浮点测试或两个变量的比较</u>,则应使用if else语句
- ✓如果所有的选项都可以使用整数常量来标识,则可以使用switch语句或if else语句。如果选项超过两个,则就代码长度和执行速度而言,switch语句效率更高

提示:如果既可以使用if else语句,也可以使用switch语句,则当选项不小于3个时,应使用switch语句

景

• break和continue语句

6.1 break和continue语句

- ✓break和continue语句都使程序能够 跳过部分代码
- ✓ switch语句或任何循环中使用break 语句,使程序跳到switch或循环后面 的语句处执行
- ✓ continue语言用于循环中,让程序跳 过循环体中余下的代码,并开始新一 轮循环

6.1 break和continue语句

✓ break和continue的区别

```
while(表达式1) {
    语句序列1;
    break/continue;
    语句序列2;
}
```

例:给出下列程序的运行结果

```
1907 JANUARY
```

```
#include <iostream>
using namespace std;
                 i=1 \text{ sum}=0
int main()
    int i=0, sum=0;
    while(i<1000) {
         i++;
         break;
         sum=sum+i;
    cout << "i=" << i
          << " sum=" << sum
          << endl;</pre>
                   ™ Microsoft Visual Studio 调试控制台
    return 0;
                   i=1 sum=0
```

```
#include <iostream>
using namespace std;
                i=1000 \text{ sum}=0
int main()
    int i=0, sum=0;
    while(i<1000) {
         i++;
         continue;
         sum=sum+i;
    cout << "i=" << i
          << " sum=" << sum
          << endl;</pre>
                  Microsoft Visual Studio 调试控制台
    return 0;
```

总结

- if语句
- 1. if 语句
- 2. if else语句
- 3. 格式化if else 语句
- 4. if else if else结构

•逻辑表达式

- 1. 逻辑OR运算符: ||
- 2. 逻辑AND运算符: &&
- 3. 用&&来设置取值范围
- 4. 逻辑NOT运算符:!
- 5. 逻辑运算符细节
- 6. 其他表示方式

- •字符函数库cctype
- •?:运算符
- switch语句
- 1. switch语句
- 2. 将枚举量用作标签
